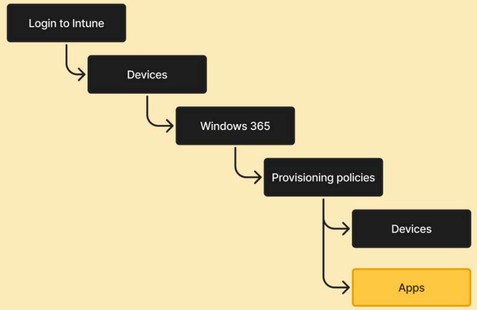
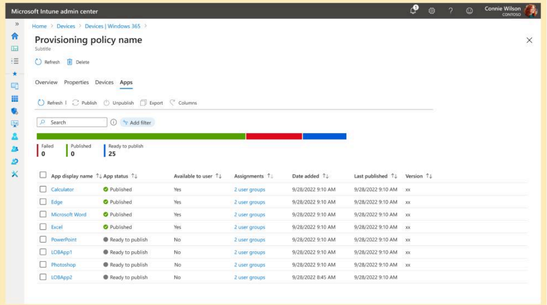
EARLY EXPLORATION

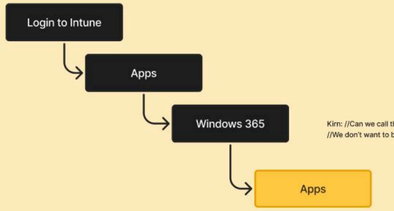
Access | Workshop with stakeholders to analyze workflows

Option 1



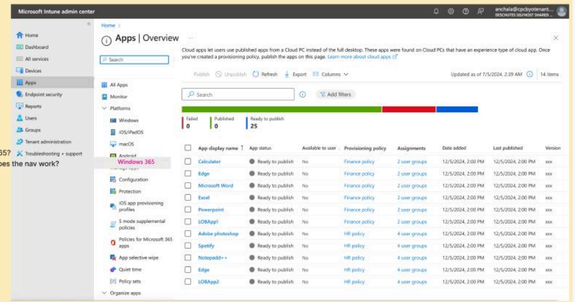


Option 3- Move app management in APPS. Policy is still created in W365



Kim: //Can we call the nav Cloud Apps instead of W365?
//We don't want to be buried under Windows? How does the nav work?

Abena: //Are these all my apps regardless of the type?



Abena: Clarity between devices and apps

Pros

Align with teams' mental model that apps are associated with provisioning

Anchal Aggarwal

No major changes in UX. Less learning a new experience for users

Anchal Aggarwal

Avoids admin to go to multiple screens and everything related ro W365 is in 1 place.

Anchal Aggarwal

Scott D: I like this the best because their is such a close relationship between the APP instance and the Pool devices.

Contextual to policies, allows admins to see and manage apps within the same management plane

Prashanth Chandrasekar Narayan...

Remaining in the existing W365 blade within devices - the same workflow admins would take to manage CPCs today

Kim Bhola

Cons

Apps under devices is misleading

+1

Anchal Aggarwal

Two different management planes for apps. Is that confusing? (all cloud apps list vs apps being contextual to a policy). Does this placement make the all cloud apps list obsolete?

Feel this to be more helpful than all cloud apps.

Prashanth Chandrasekar Narayanan

We are choosing to stay within the devices blade for some of the wrong reasons, which is that we have always lived here.

I think its worth exploring other options (apps blade) even if that means we are challenging the current system/mental model

Kim Bhola
